Object Literal Enhancements

Shorthand Object Literal Creation

Shortened Method Syntax
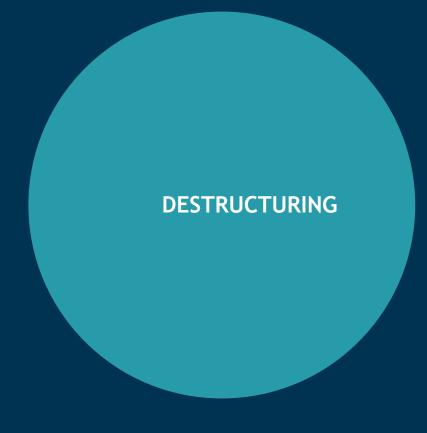

Computed Keys

Destructuring

Destructuring

Destructuring is a relatively new syntax enhancement for JavaScript.

It allows us to assign a set of variables the contents of a data structure.

Destructuring syntax is meant to mirror the data structure being broken apart.

DESTRUCTURING

Destructuring can be performed anywhere a variable can be declared!

That includes function parameters, constructor arguments, and nested inside other destructuring statements.
